ABSTRACT

Sequin feeding operation is performed by causing a feed lever (18) to move forward with a distal end hook portion (18a) of the feed lever engaging a sequin center hole (3a) of a continuous sequin strip (3) let out from a reel (5) and then placed on the upper surface of a supporting plate (8), and the successive sequins can be fed one by one by repeating forward and rearward movement of the feed lever. Lock lever (33) having an engaging claw (33a) engageable with the sequin center hole is pivotably supported near the feed lever. When predetermined pitch feeding, by the feed lever, of the continuous sequin strip has been completed, the engaging claw (33a) of the lock lever is caused to engage a center hole following the center hole engaged by the hook portion of the feed lever, to thereby immovably lock the continuous sequin strip.

(54) Title: SEQUIN FEEDER

(54) 発明の名称: シークイン送り装置

at the tip of a feed lever (18) is engaged with a sequin center hole (3a) in a sequin connection body (3) delivered from a reel (5) and placed on the upper surface of a pivotally supporting plate (8) and the feed lever is moved forward to perform a sequin feed operation and repeatedly moved forward and backward to feed sequins one by one, a lock lever (33) having an engagement claw (33a) engageable with the sequin center hole fitted thereto is swingably supported near the feed lever, and when the feed operation with a specified pitch by the feed lever is completed, the engagement claw (33a) of the lock lever is engaged with the other center hole following the center hole engaged with the hook part of the feed lever to immovably lock the sequin connection body.
